

# Developing definitions of response to biological treatment for severe asthma

We are looking for patients with severe asthma to support researchers to develop **patient-centred definitions of response** to biological treatments for severe asthma. Biological treatments are injected medications such as Xolair, Nucala, Cinquero, Fasentra, Dupixent.

Did you know there is no definition for whether a biological treatment is 'working' or not for severe asthma?

If we can define response it will help doctors and patients to decide whether a biological treatment should be continued or if alternative treatments should be used instead.

We need your expert help to ensure that researchers measure aspects which are most important to patients.

## Are you:

- ≥ 12 years old and have severe asthma
- a parent or carer of a person with severe asthma ≥ 6 years old
- taking / previously taken a biological treatment (but not mandatory)

No specific skills are required, just a passion to help improve the care of patients with severe asthma.

## What and when?

The study includes the following on-line activities:

- ✓ a training session (1 hour)
- ✓ two online surveys (2 hours)
- ✓ a consensus meeting (1 hour)
- ✓ January – March 2022
